Project Phases: Implement Client Script & UI Policy (Incident)

Prepared by Noorun Afra

Phase 1: Requirement Analysis

Study the problem statement: incident records often need extra controls when an incident has a high impact. Identify the table (Incident), the trigger field (Impact) and the fields to control.

Phase 2: Environment Setup

Register on ServiceNow University, launch the lab instance from the course page and log in with admin access.

Phase 3: Design

Plan the UI Policy (name, table, condition, actions) and the Client Scripts (onChange on Impact, onSubmit validation).

Phase 4: Create the UI Policy

1. Navigate to System UI > UI Policies and click New.
2. Name: High Impact Control. Table: Incident. Active: true.
3. Condition: Impact is 1 - High.
4. Submit, then add UI Policy Actions (for example, make Assignment group and Description mandatory).

Phase 5: Create the Client Scripts

1. Navigate to System Definition > Client Scripts and click New.
2. Create an onChange script on the Impact field.
3. Create an onSubmit script for form validation.
4. The code is in the attached code file.

Phase 6: Testing

Open Incident > Create New. Set Impact to 1 - High and confirm the fields become mandatory and the message appears. Set Impact to Low and confirm they return to normal. Test submitting with a short description under 10 characters.

Phase 7: Conclusion

The UI Policy and Client Scripts control the Incident form dynamically, improving data quality and guiding users on high impact incidents.
